1.0. Introduction

The ACM1252U-Y3 USB NFC Reader Module is a USB PC-linked contactless card reader/writer developed based on the 13.56 Mhz contactless technology. It supports ISO 14443 Part 4 Type A and B Cards, MIFARE® cards, FeliCa cards, and all four types of NFC (ISO/IEC 18092 tags).

The ACM1252U-Y3, which is the module version of ACR1252U, supports the three modes of NFC, namely: NFC card reader/writer, Card emulation and Peer-to-Peer communication modes. The ACM1252U-Y3 comes with a detachable antenna and an optional USB cable with Molex connector.

5.0. Host Programming (PC-linked) API

5.1. PCSC API

This section will describe some of the PCSC API for application programming usage. For more details, please refer to Microsoft MSDN Library or PCSC workgroup.

5.1.1.   SCardEstablishContext

The SCardEstablishContext function establishes the resource manager context within which database operations are performed.

Refer to: http://msdn.microsoft.com/en-us/library/windows/desktop/aa379479%28v=vs.85%29.aspx

This function should be performed first before any other PCSC operation.

Example:

```c
#define SCARD_SCOPE_USER 0

SCARDCONTEXT hContext;
int retCode;
void main ()
{
   // To establish the resource manager context and assign it to "hContext"
   retCode = SCardEstablishContext(SCARD_SCOPE_USER,
                 NULL,
                 NULL,
                 &hContext);
   if (retCode != SCARD_S_SUCCESS)
   {
      // Establishing resource manager context failed
   }
   else
   {
      // Establishing resource manager context successful
      // Further PCSC operation can be performed
   }

}
```

5.1.2. SCardListReaders

The SCardListReaders function provides the list of readers within a set of named reader groups, eliminating duplicates.

The caller supplies a list of reader groups and receives the list of readers within the named groups. Unrecognized group names are ignored. This function only returns readers within the named groups that are currently attached to the system and available for use.

Refer to: http://msdn.microsoft.com/en-us/library/windows/desktop/aa379793%28v=vs.85%29.aspx

Example:

```c
#define SCARD_SCOPE_USER 0

SCARDCONTEXT hContext; // Resource manager context
int retCode;
char readerName [256]; // List reader name

void main ()
{
    // To establish the resource manager context and assign to "hContext"
    retCode = SCardEstablishContext(SCARD_SCOPE_USER,
                NULL,
                NULL,
                &hContext);
    if (retCode != SCARD_S_SUCCESS)
    {
        // Establishing resource manager context failed
    }
    else
    {
        // Establishing resource manager context successful
        // List the available reader which can be used in the system
        retCode = SCardListReaders (hContext,
                NULL,
                readerName,
                &size);
        if (retCode != SCARD_S_SUCCESS)
        {
            // Listing reader fail
        }
        if (readerName == NULL)
        {
            // No reader available
        }
        else
        {
            // Reader listed
        }
    }
}
```

5.1.3. SCardConnect

The SCardConnect function establishes a connection (using a specific resource manager context) between the calling application and a smart card contained by a specific reader. If no card exists in the specified reader, an error is returned.

Refer to: http://msdn.microsoft.com/en-us/library/windows/desktop/aa379473%28v=vs.85%29.aspx

Example:

```c
#define SCARD_SCOPE_USER 0

SCARDCONTEXT      hContext;       // Resource manager context
SCARDHANDLE       hCard;          // Card context handle
unsigned long     dwActProtocol;  // Establish active protocol
int               retCode;
char              readerName [256]; // List reader name
char              rName [256];       // Reader name for connection

void main ()
{
    …
        if (readerName == NULL)
        {
            // No reader available
        }
        else
        {
            // Reader listed
        rName = "ACS ACR1252 CL Reader PICC 0";   // Depends on what
                                                   reader be used
                                                   // Should connect to
                                                   PICC interface

            retCode = SCardConnect(hContext,
                rName,
                SCARD_SHARE_SHARED,
                SCARD_PROTOCOL_T0,
                &hCard,
                &dwActProtocol);
            if (retCode != SCARD_S_SUCCESS)
            {
                // Connection failed (May be because of incorrect reader
            name, or no card was detected)
            }
            else
            {
                // Connection successful
            }
        }
    }
```

5.1.4. SCardControl

The SCardControl function gives you direct control of the reader. You can call it any time after a successful call to SCardConnect and before a successful call to SCardDisconnect. The effect on the state of the reader depends on the control code.

Refer to: http://msdn.microsoft.com/en-us/library/windows/desktop/aa379474%28v=vs.85%29.aspx

*Note: Commands from **Peripherals Control** use this API for sending.*

Example:

```
#define SCARD_SCOPE_USER    0

#define EscapeCommand 0x310000 + 3500*4
    SCARDCONTEXT         hContext;          // Resource manager context
    SCARDHANDLE          hCard;             // Card context handle
    unsigned long        dwActProtocol;     // Established active protocol
    int                  retCode;
    char                 readerName [256];  // Lists reader name
    char                 rName [256];       // Reader name for connection
    BYTE                 SendBuff[262],     // APDU command buffer
                         RecvBuff[262];     // APDU response buffer
    BYTE                 FWVersion [20],    // For storing firmware
                                            // version message
    BYTE                 ResponseData[50];  // For storing card response
    DWORD                SendLen,           // APDU command length
                         RecvLen;           // APDU response length
void main ()
    {
        …
        rName = "ACS ACR1252 CL Reader PICC 0";        // Depends on what
                                                       // reader will be used
                                                       // Should connect to
                                                       // PICC interface

        retCode = SCardConnect(hContext,
            rName,
            SCARD_SHARE_DIRECT,
            SCARD_PROTOCOL_T0| SCARD_PROTOCOL_T1,
            &hCard,
            &dwActProtocol);
        if (retCode != SCARD_S_SUCCESS)
        {
            // Connection failed (may be because of incorrect reader
        name, or no card was detected)
        }
        else

```c

            RecvLen,
            &RecvLen);
    if (retCode != SCARD_S_SUCCESS)

        return;
    }
    else
    {
        // APDU sending success
    }
```

5.1.5. SCardTransmit

The SCardTransmit function sends a service request to the smart card and expects to receive data back from the card.

Refer to: http://msdn.microsoft.com/en-us/library/windows/desktop/aa379804%28v=vs.85%29.aspx

*Note: APDU Commands (i.e. the commands sent to connected card, **PICC Commands for MIFARE® Classic (1K/4K) Memory Cards** and **Pseudo APDU for Contactless Interface**) use this API for sending.*

Example:

```c
#define SCARD_SCOPE_USER      0

SCARDCONTEXT       hContext;        // Resource manager context
SCARDHANDLE        hCard;           // Card context handle
unsigned long      dwActProtocol;   // Established active protocol
int                retCode;
char               readerName [256]; // List reader name
char               rName [256];     // Reader name for connect
BYTE               SendBuff[262],   // APDU command buffer
                   RecvBuff[262];   // APDU response buffer

DWORD              SendLen,         // APDU command length
                   RecvLen;         // APDU response length
SCARD_IO_REQUEST   ioRequest;

void main ()
{
    …
    rName = "ACS ACR1252 CL Reader PICC 0";   // Depends on what reader
                                              should be used
                                              // Should connect to PICC
                                              interface

        retCode = SCardConnect(hContext,
                   rName,
                   SCARD_SHARE_SHARED,
                   SCARD_PROTOCOL_T0,
                   &hCard,
                   &dwActProtocol);
    if (retCode != SCARD_S_SUCCESS)
    {
        // Connection failed (May be because of incorrect reader
        name, or no card was detected)
    }
    else
    {
        // Connection successful
        ioRequest.dwProtocol = dwActProtocol;
        ioRequest.cbPciLength = sizeof(SCARD_IO_REQUEST);
        RecvLen = 262;
```

```
// Get MIFARE UID/ FeliCa IDM
SendBuff[0] = 0xFF;
SendBuff[1] = 0xCA;
SendBuff[2] = 0x00;
SendBuff[3] = 0x00;

retCode = SCardTransmit( hCard,
                &ioRequest,
                SendBuff,
                SendLen,
                NULL,
                RecvBuff,
                &RecvLen);

if (retCode != SCARD_S_SUCCESS)
{
    // APDU sending failed
    return;
}
else
{
    // APDU sending successful
    // The RecvBuff stores the IDM for FeliCa / the UID for
    MIFARE.
    // Copy the content for further FeliCa access
    for (int i=0;i< RecvLen-2;i++)
    {
        CardID [i] = RecvBuff[i];
    }
}
```

5.1.6. SCardDisconnect

The **SCardDisconnect** function terminates a connection previously opened between the calling application and a smart card in the target reader.

Refer to: http://msdn.microsoft.com/en-us/library/windows/desktop/aa379475%28v=vs.85%29.aspx

This function ends the PCSC Operation.

Example:

```
#define SCARD_SCOPE_USER 0

SCARDCONTEXT      hContext;        // Resource manager context
SCARDHANDLE       hCard;           // Card context handle
unsigned long     dwActProtocol;   // Established active protocol
int               retCode;

void main ()
{
    …
          // Connection successful

       …
       retCode = SCardDisconnect(hCard,SCARD_RESET_CARD);
       if (retCode != SCARD_S_SUCCESS)
       {
           // Disconnection failed
       }
       else
       {
           // Disconnection successful
       }
    }
}
```

5.2.5. Accessing PCSC-compliant tags (ISO 14443-4)

All ISO 14443-4 compliant cards (PICCs) understand the ISO 7816-4 APDUs. The ACM1252U-Y3 reader just has to communicate with the ISO 14443-4 compliant cards through exchanging ISO 7816-4 APDUs and responses. The ACM1252U-Y3 will handle the ISO 14443 Parts 1-4 Protocols internally.

MIFARE Classic (1K/4K), MIFARE Mini and MIFARE Ultralight tags are supported through the T=CL emulation. Simply treat the MIFARE tags as standard ISO 14443-4 tags. For more information, please refer to **Section 5.2.4 PICC Commands for MIFARE® Classic (1K/4K) Memory Cards**.

ISO 7816-4 APDU Format

Command	Class	INS	P1	P2	Lc	Data In	Le
ISO 7816 Part 4 Command					Length of the Data In		Expected length of the Response Data

ISO 7816-4 Response Format (Data + 2 bytes)

Response	Data Out		
Result	Response Data	SW1	SW2

Common ISO 7816-4 Response Codes

Results	SW1 SW2	Meaning
Success	90 00h	The operation was completed successfully.
Error	63 00h	The operation failed.

Typical sequence may be:

1. Present the tag and connect the PICC Interface.
2. Read/Update the memory of the tag.

To do this:

1. Connect the tag.

   The ATR of the tag is 3B 88 80 01 00 00 00 00 33 81 81 00 3Ah.

   In which,

   The Application Data of ATQB = 00 00 00 00, protocol information of ATQB = 33 81 81. It is an ISO 14443-4 Type B tag.

2. Send an APDU, Get Challenge.

   << 00 84 00 00 08h

   >> 1A F7 F3 1B CD 2B A9 58h [90 00h]

   Note: *For ISO 14443-4 Type A tags, the ATS can be obtained by using the APDU "FF CA 01 00 00h."*

Example:

// Read 8 bytes from an ISO 14443-4 Type B PICC (ST19XR08E)

APDU = {80 B2 80 00 08h}

Class = 80h

INS = B2h

P1 = 80h

P2 = 00h

Lc = None

Data In = None

Le = 08h

Answer: 00 01 02 03 04 05 06 07h [$9000h]

5.2.6. Accessing FeliCa tags

For FeliCa access, the command is different from those used in PCSC-compliant and MIFARE tags. The command follows the FeliCa specification with an added header.

FeliCa Command Format

Command	Class	INS	P1	P2	Lc	Data In
FeliCa Command	FFh	00h	00h	00h	Length of the Data In	FeliCa Command (start with Length Byte)

FeliCa Response Format (Data + 2 bytes)

Response	Data Out
Result	Response Data

Read Memory Block Example:

1. Connect the FeliCa.

   The ATR = 3B 8F 80 01 80 4F 0C A0 00 00 03 06 11 00 3B 00 00 00 00 42h

   In which, 11 00 3Bh = FeliCa

2. Read FeliCa IDM.

   CMD = FF CA 00 00 00h

   RES = [IDM (8bytes)] 90 00h

   e.g., FeliCa IDM = 01 01 06 01 CB 09 57 03h

3. FeliCa command access.

   Example: "Read" Memory Block.

   CMD = FF 00 00 00 10 10 06 01 01 06 01 CB 09 57 03 01 09 01 01 80 00h

         where:

               Felica Command = 10 06 01 01 06 01 CB 09 57 03 01 09 01 01 80 00h

               IDM = 01 01 06 01 CB 09 57 03h

   RES = Memory Block Data

5.3.8. Set Automatic PICC Polling

This command is used to set the reader's polling mode.

Whenever the reader is connected to a PC, the PICC polling function will start the PICC scanning to determine if a PICC is placed on/removed from the built-in antenna.

You can send a command to disable the PICC polling function. The command is sent through the PCSC Escape command interface. To meet the energy saving requirement, special modes are provided for turning off the antenna field whenever the PICC is inactive, or no PICC is found. The reader will consume less current in power saving mode.

Note: The setting will be saved into non-volatile memory. Bit 6 Option is applicable only to firmware version 208.0 and above.

Note: Default value of Polling Setting = 8Bh.

ACM1252U-Y3 – Reference Manual
Version 1.04
info@acs.com.hk
www.acs.com.hk

1. It is recommended to enable the option "Turn Off Antenna Field if the PICC is inactive", so that the "Inactive PICC" will not be exposed to the field all the time to prevent the PICC from "warming up".

2. The longer the PICC Poll Interval, the more efficient of energy saving. However, the response time of PICC Polling will become longer. The Idle Current Consumption in Power Saving Mode is about 60 mA, while the Idle Current Consumption in Non-Power Saving mode is about 130mA.

    Note: Idle Current Consumption = PICC is not activated.

3. The reader will activate the ISO 14443A-4 mode of the "ISO 14443A-4 compliant PICC" automatically. Type B PICC will not be affected by this option.

4. The JCOP30 card comes with two modes: ISO 14443A-3 (MIFARE Classic 1K) and ISO 14443A-4 modes. The application has to decide which mode should be selected once the PICC is activated.

5. When the option "NXP MIFARE ISO/IEC 14443 PICC Selection" is enabled, SAK 28h is recognized as Mifare Classic 1K and SAK 38h as Mifare Classic 4K.

5.3.14. Set Auto PPS

Whenever a PICC is recognized, the reader will try to change the communication speed between the PCD and PICC as defined by the maximum connection speed. If the card does not support the proposed connection speed, the reader will try to connect to the card with a slower speed setting.

Set Auto PPS Format (7 bytes)

00h = 106 Kbps; default setting, equal to No Auto PPS

01h = 212 Kbps

02h = 424 Kbps

Notes:

1. *Normally, the application should know the maximum connection speed of the PICCs being used. The environment also affects the maximum achievable speed. The reader just uses the proposed communication speed to talk with the PICC. The PICC will become inaccessible is the PICC or environment does not meet the requirement of the proposed communication speed.*

2. *The reader supports different speeds for sending and receiving.*

Data Out   SW1 SW2. Status Code returned by the reader.

Status Code

Results	SW1	SW2	Meaning
Success	90h	Current LED State	The operation was completed successfully.
Error	63h	00h	The operation failed.

Current LED State (1 byte)

Status	Item	Description
Bit 0	Current Red LED	1 = On; 0 = Off
Bit 1	Current Green LED	1 = On; 0 = Off
Bits 2 – 7	RFU	RFU

Reminders:

1. *The LED State operation will be performed after the LED Blinking operation is completed.*

2. *The LED will not change if the corresponding LED Mask is not enabled.*

3. *The LED will not blink if the corresponding LED Blinking Mask is not enabled. Also, the number of repetitions must be greater than zero.*

4. *T1 and T2 duration parameters are used to control the duty cycle of LED blinking and Buzzer Turn-On duration. For example, if T1=1 and T2=1, the duty cycle = 50%.*

   Note: Duty Cycle = T1/(T1 + T2).

5. *To control the buzzer only, just set the P2 "LED State Control" to zero.*

6. *To make the buzzer operate, the "number of repetitions" must greater than zero.*

7. *To control the LED only, just set the parameter "Link to Buzzer" to zero.*
